² Roztocze National Park, Poland

Project:

Assesment of the effects of forest stand conversion activities in the Roztocze National Park (RPN)

Period:

2021, data resulting from previous projects were also used

Funding:

Forest Fund, Polish State Forests

**Contractor:**

Foundation for Biodiversity Research, Wrocław, Poland

Author team:

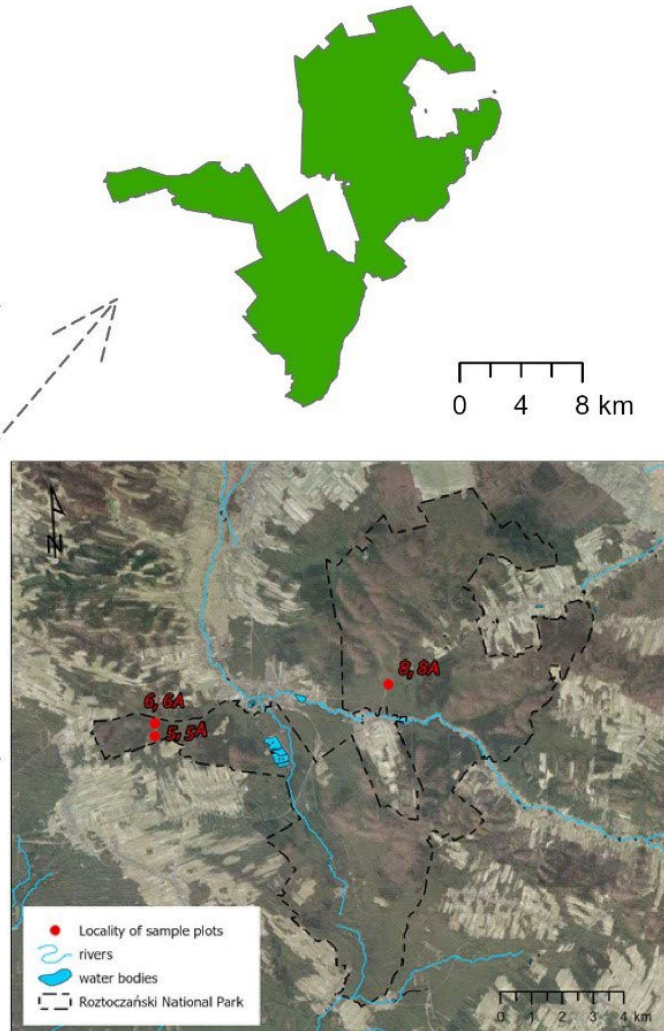

Final report: Remigiusz Pielech, Zbigniew Maciejewski

Collaboration: Kacper Foremnik, Piotr Król, Ewa Maciejewska, Marek Malicki, Bartłomiej Surmacz, Adrian Wysocki

Scientific consultant: Jerzy Szwagrzyk

Roztocze National Park

Established in 1974

Total area: 84.83 km²

Forest cover: 95.5%

Aims of stand conversion activities

- 1) Support regeneration of native tree species
- 2) Decrease regularity in tree distribution

In the long run: increase naturalness of forest ecosystems and support regional biodiversity.

Project aims

Assesment of effectivness of stand conversion activities

at three dimensions:

- spatial distribution of trees
- natural regeneration
- diversity of herbacious vegetation

Study objects

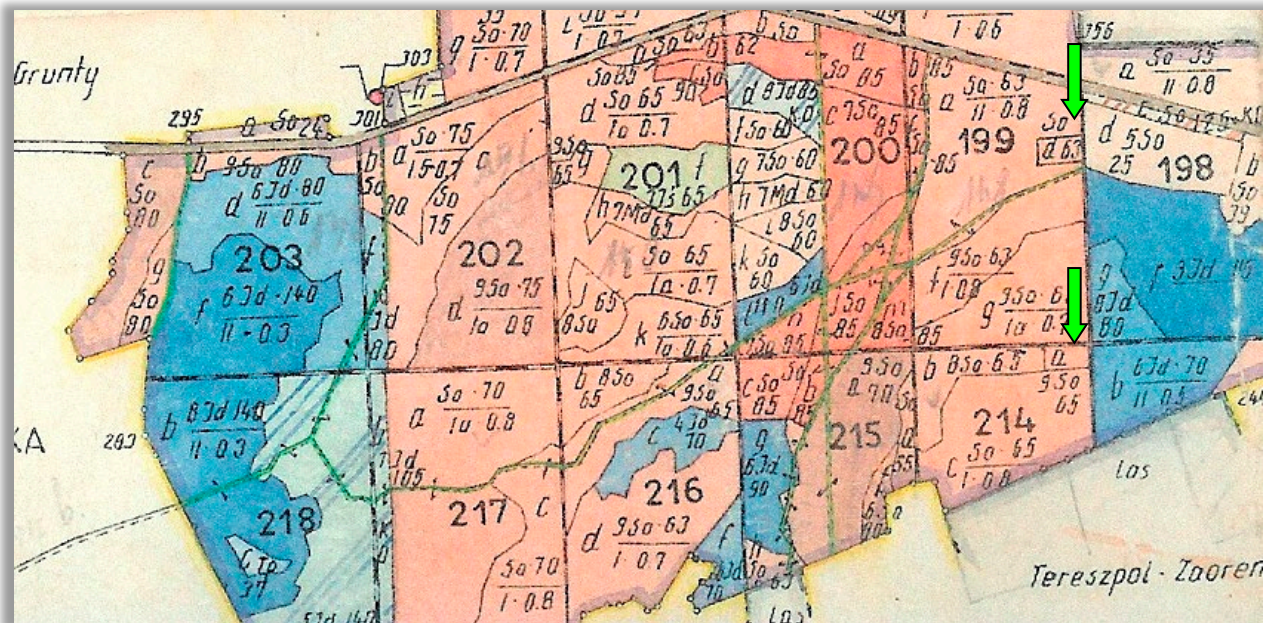

Three pairs of twin plots:

- plots subjected to stand conversion (5A, 6A, 8A)
- control plots – no management activities (5, 6, 8)

Plot area: 0.5 ha (50 x 100 m)

Control plots

- Established in 1971 -1973 – prof. K. Izdebski
- Recovered in 1990s – dr. Z. Maciejewski
- Excluded from management activities for more than 50 yrs

Plot 5A (conversion)

Field works

We used  Field-Map to measure all live and dead trees with DBH ≥ 7 cm

- Position
- Species
- Condition
- DBH

Field works

Herbaceous vegetation was analysed on 0.5 m² circle plots (364 in total)

- Species composition and percentage cover
- Number of seedlings

poor coniferous stands

mesophilous stands

Field works

Field works

Natural regeneration was analysed on 0.5 m² circle plots (364 in total)

- Number of seedlings, short sapling (< 0,5 m) and tall saplings (h > 0,5 m; dbh < 7 cm)

Diversity of herbaceous vegetation

Forest regeneration

Conclusions

1. We found confirmation for positive effects of stand conversion on former Scots pine plantations.
2. Effect of stand conversion is subtle due to low intensity of management activities
3. In order to decrease regularity of trees, further management practices could be preceded by simulations of tree distribution patterns using geostatistical tools (Ripley's function, g function or others)
